## Abstract

Rearrangements on conditionally convergent series suggests the existence of a similar process for integrals, here also referred to as rearrangement. In this document, a general theorem concerning rearrangement for conditionally convergent integrals is presented, as well as supporting theorems and a corollary to the general theorem. The corollary reads: Let  $f : \mathbb{R}^+ \rightarrow \mathbb{R}^+$  be a continuous function with an everywhere negative and monotone increasing derivative. If  $\int_1^\infty (-1)^x f(x) dx$  is conditionally convergent, then  $\forall z \in \mathbb{C}$ , there exists an arrangement on  $\int_1^\infty (-1)^x f(x) dx$  such that  $z = \int_1^\infty (-1)^x f(x) dx$ .
